Taynakh

Taynakh is a play on the term “Tanakh”, which is the term used for the collaborative summarization of Jewish law. This project is intended to create an open-source and self-hosted repository of media for the use in personal and academic settings. A user will be able to curate their own collection of academic sources for them to sort, create links between, generate citations for, and search for quotes within.

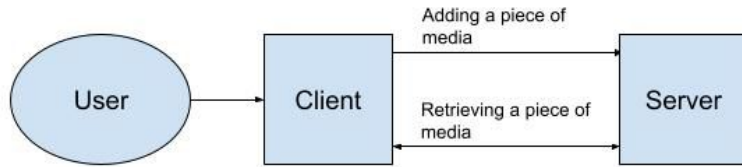

User Stories

- As a user, I want to be able to save an article, so that I can access the article at a later date
- As a user, I want to be able to search through my archive, so I can locate an article that I have previously saved
- As a user, I want to be able to get a plain text version of an uploaded PDF, so that I can more easily read it
- As a user, I want to be able to create a citation for an article based on the text of an article, so that I can cite it
- As a user, I want to be able to get a summary of an article, so that I can better understand an article at a glance
- As a user, I want to be able to tag an article, so that I can more easily find it later
- As a user, I want to be able to see what other articles an article cites, so that I can better see the connections between articles

Project Constraints

Economic

- Project is unable to leverage the traditional methods of profit generation for comparable products

Legal

- Potential copyright complications with hosting copyrighted work

Social

- This software would grant an easier ability to organize and track academic works for free

Project Progress

This presentation contains the majority of the work on this project to date.

Work has begun on designing the database schema and programming environment which will be used for the implementation of the project.

Division of Work

As there is only one member of this group, all of the tasks for this project will be taken on by Sean B.

Expected Demo of Work

A fully functional server and client system where a user can add a PDF article to their personal repository, search through their existing repository, and categorize their existing media elements.
